SUMMARY

Software developer working across React, TypeScript, Node.js, and Python, with production code running on AWS. Two years evaluating large language model output at Outlier AI: grading responses against structured criteria, catching the answers that look right and aren't, and writing up the failure modes so they could be fixed upstream. Heavy daily user of AI coding tools, Claude Code in particular. Comfortable taking a thin requirement through to something running in front of users, and opinionated about testing and system design without letting it slow the work down.

RELEVANT SKILLS

Languages & Frameworks: TypeScript, JavaScript, React, Next.js, Node.js, Python, Java, HTML, CSS, Angular

LLM & AI Work: prompt engineering, model output evaluation, grading criteria design, failure-mode analysis, AI coding tools (Claude Code, Codex, Copilot)

Back-End & Cloud: RESTful APIs, microservices, AWS, MongoDB (NoSQL), PostgreSQL, MySQL (SQL)

Testing & Tools: unit & integration testing, debugging, code reviews, performance tuning, Git, GitHub, GitHub Actions, CI/CD, Agile/Scrum

PROFESSIONAL EXPERIENCE

Software Developer

November 2025 – Present

Collective Interchange – St. John's, NL

- Shipped full-stack features end to end in TypeScript/JavaScript, Next.js, and Python against a MongoDB backend, from first requirement through to production.
- Owned production issue resolution: read the logs, traced the request through each layer, found the root cause, and got the fix out with minimal turnaround.
- Used AI coding tools heavily for scaffolding, refactors, and test coverage, reviewing every diff before it landed rather than accepting output on trust.

Software Developer (AI Trainer)

October 2024 – Present

Outlier AI – Remote

- Evaluated large volumes of LLM output for correctness, data integrity, and logical consistency, applying structured grading criteria across hundreds of assessments.
- Caught failure cases that automated checks missed, then documented the failure modes and recommended corrections to the prompts and processes upstream.
- Built a working map of how model output fails under real inputs, mostly confidently wrong answers and quietly dropped constraints. These are the same failure modes an eval suite or an agent loop has to catch.

Software Developer (Co-op)

January 2021 – September 2021

BreatheSuite Inc. – St. John's, NL

- Built front-end features in React, TypeScript, and Node.js, wiring them cleanly into backend APIs with attention to reliability and usability.
- Wrote unit and system tests across front-end and back-end components, and did the debugging when they caught something.
- Worked in Agile sprints with engineering, product, and quality teams, taking part in planning, code reviews, and retrospectives.

EDUCATION

Bachelor of Computer Science

April 2019 – February 2024

Memorial University of Newfoundland – St. John's, NL

Software Developer Courses

January 2020 – January 2021

Get-Coding Software Training Institute – St. John's, NL

PORTFOLIO & PROJECTS

Personal and academic projects are available at portfolio.zadprogramming.com, including full-stack applications with PostgreSQL and MongoDB backends and data pipeline work, each scoped and built end to end from design through deployment.
